Injection in action

Injection is the latest innovation from DIMENSION-POLYANT – never seen in the sailcloth market before! Inspired from the windsurf market where colors and pleasing looks of the sails have long been an important factor for selling sails, DIMENSION-POLYANT, Inc. has developed a process where many colors can be incorporated into a visually pleasing yet totally random color pattern.

As in other high end sport equipment DP wants to offer a custom pattern unique to the individual. While the colors used in **Injection** Technology are well controlled in our process, **Injection** patterns are highly random so all sails are completely unique and it is 100% guaranteed that no two sails will be identical.

As for all DIMENSION-POLYANT laminates, one of the design criteria was to develop a visually pleasing technology that doesn't negatively affect the sailcloth's performance. **Injection** Technology is incorporated into our adhesive system so it doesn't increase the weight of the fabric. The colors are protected with our well established UV protecting additives which offer additional protection to the load carrying fibers. We are confident that **Injection** Technology hits all the spots – cool looking and top notch performance!

Working closely with the DP team we have come up with three basic color offerings that are available in PE05 3.0 mil construction – Green, Purple and Tangerine specifically developed for the fast growing multihull markets.

This new **Injection** Technology is still in the early stages and our knowledgeable staff can assist with questions you may have on how your loft may incorporate it in certain sailcloth styles or classes you are currently working with.
